

# Accurate maps for precise designs for land development

## For surveyors

Getting your topographical surveys is no longer complicated in places with no/limited access

You can now fly over a formerly-inaccessible large area with the WingtraOne + PPK in just one morning or afternoon. From this, you'll get accurate topographic maps in a few hours and deliver orthomosaics as well as contour lines to any/all stakeholders with just a few clicks.

### Map in tight time windows

Capture what used to be out-of-reach areas within hours. Take-off from the closest road; the drone will start collecting within minutes.

### No more hiking

No need to hike up around complex terrain or cut through dense bushes.

### High accuracy

Gather survey-grade data without the need for GCPs. Just a few checkpoints is all you need to confirm accuracy.

### Export accurate topographic maps

Create high-accuracy maps in any coordinate system to import into your GIS software and CAD designs.
